# The project description

The project was made as an example of website design and coding for a university class of software design by Mr. Karegar.
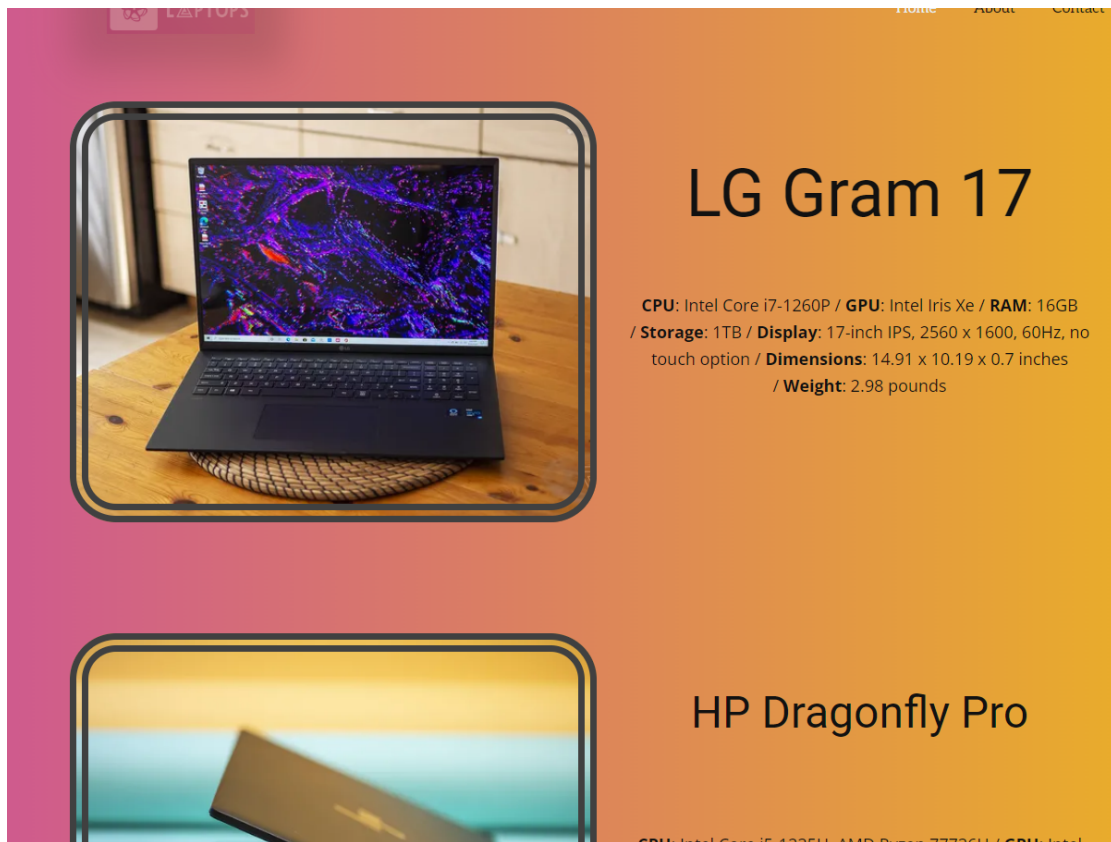

The website includes different pages, each linked to its top right.
The top bar with the page links is designed to have different coloured text for the selected page, the non-selected navigation buttons and also for when they get hovered on by mouse.

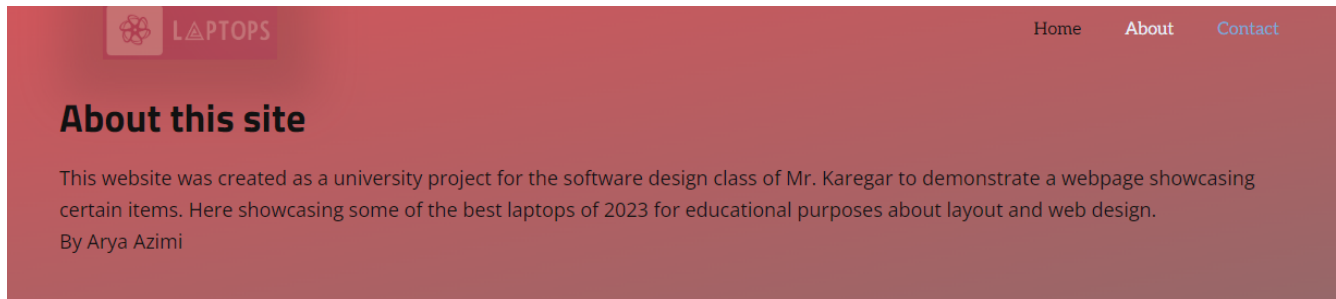

The Home page is the main one. It includes images of devices and their names as heading as well as their hardware specs as their description.
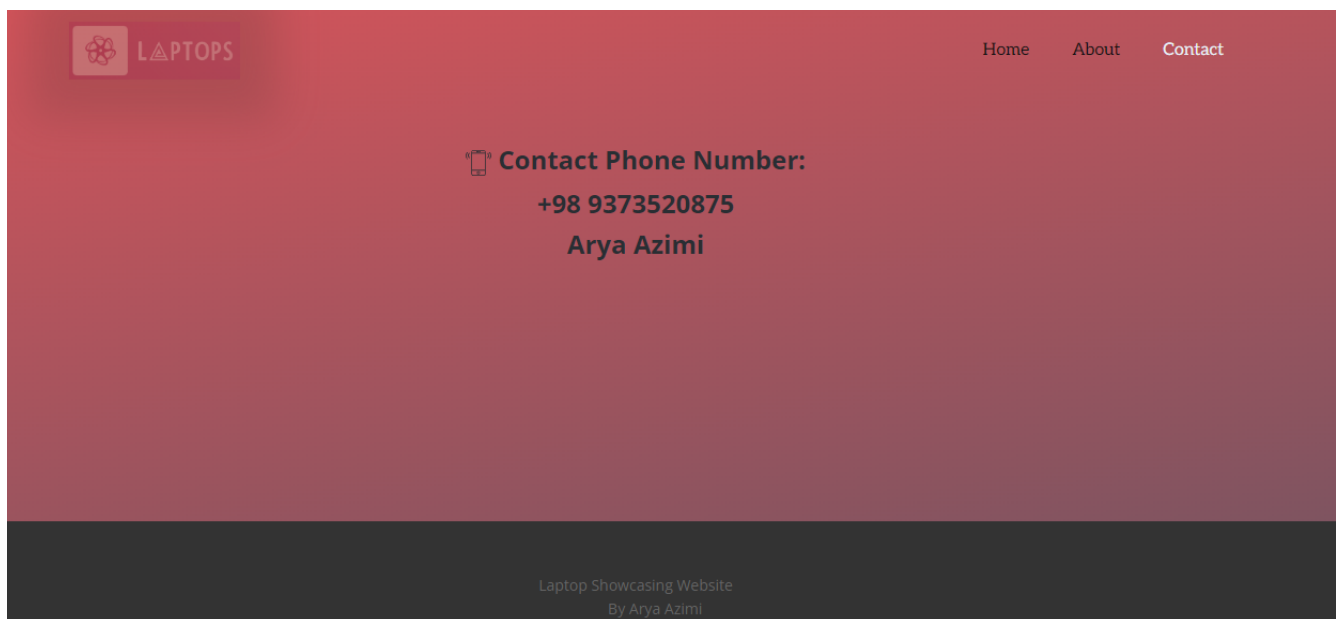

A border was set for the images fitting the design and the background to avoid them feeling out of place.

The About page describes the purpose of the website, which is demonstration for software design class as a project.

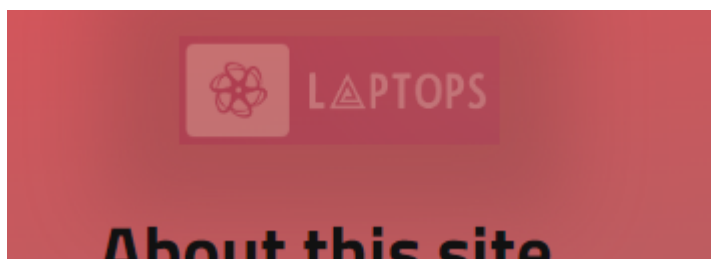

Contact page has a phone number included in it. It also has an image next to the text (The phone icon) as a UI design example.

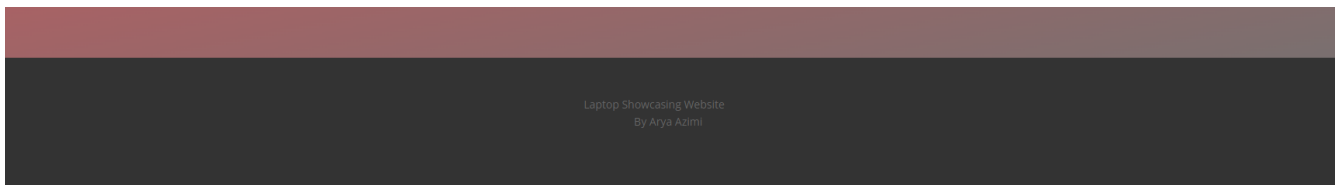

Different background colors are used on different pages for eye candy. Each of them a gradient of warm colours chosen to make the viewer feel comfortable and give them the quality product feeling.
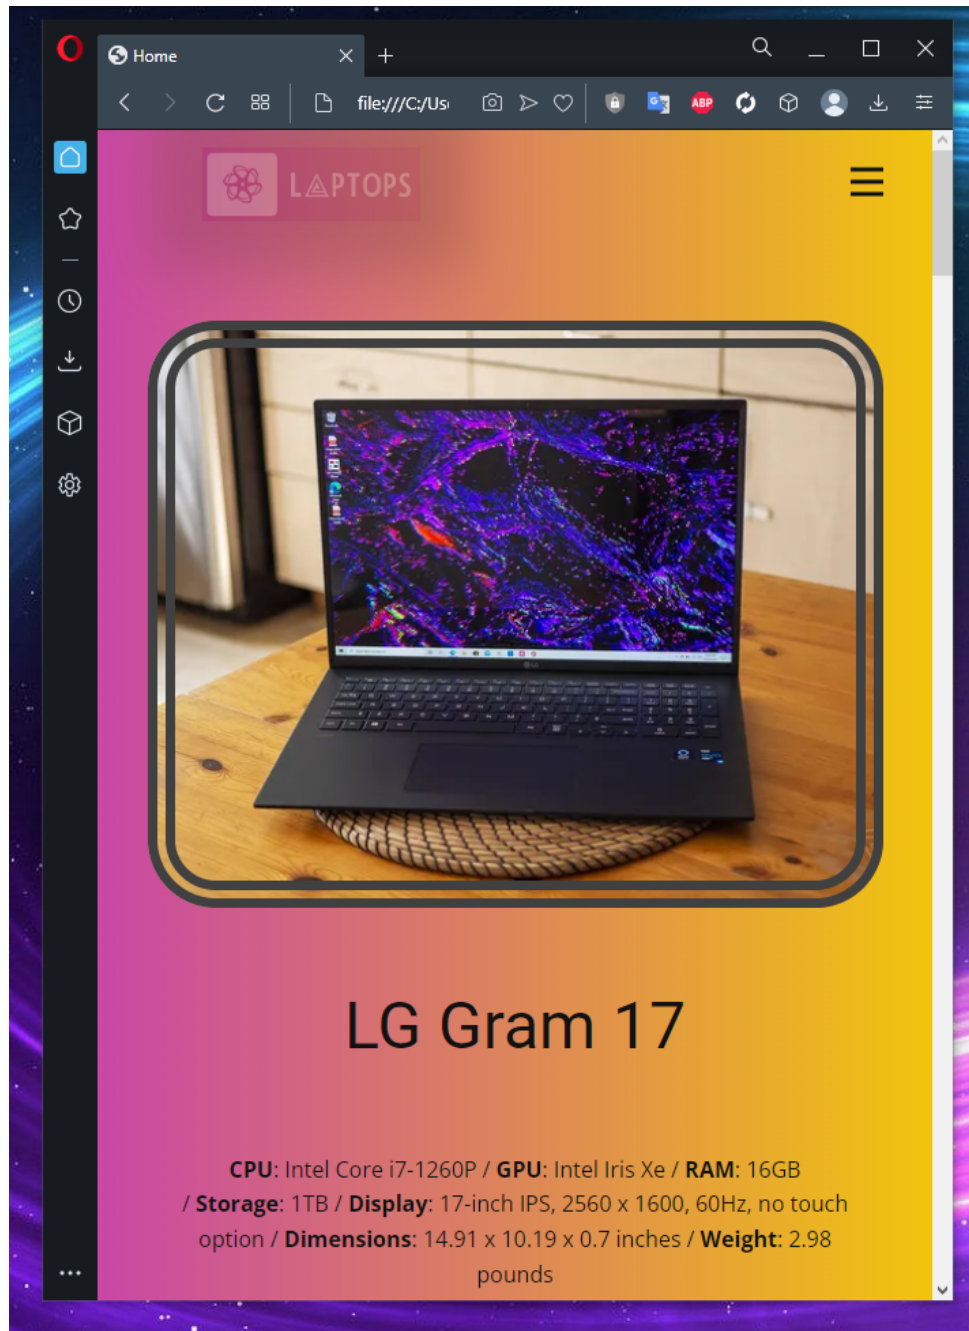

A logo was generated for this project with a title of laptops and an icon for it.
It was then chosen for it to be placed on the top left, and to be transparent, fading into the background.
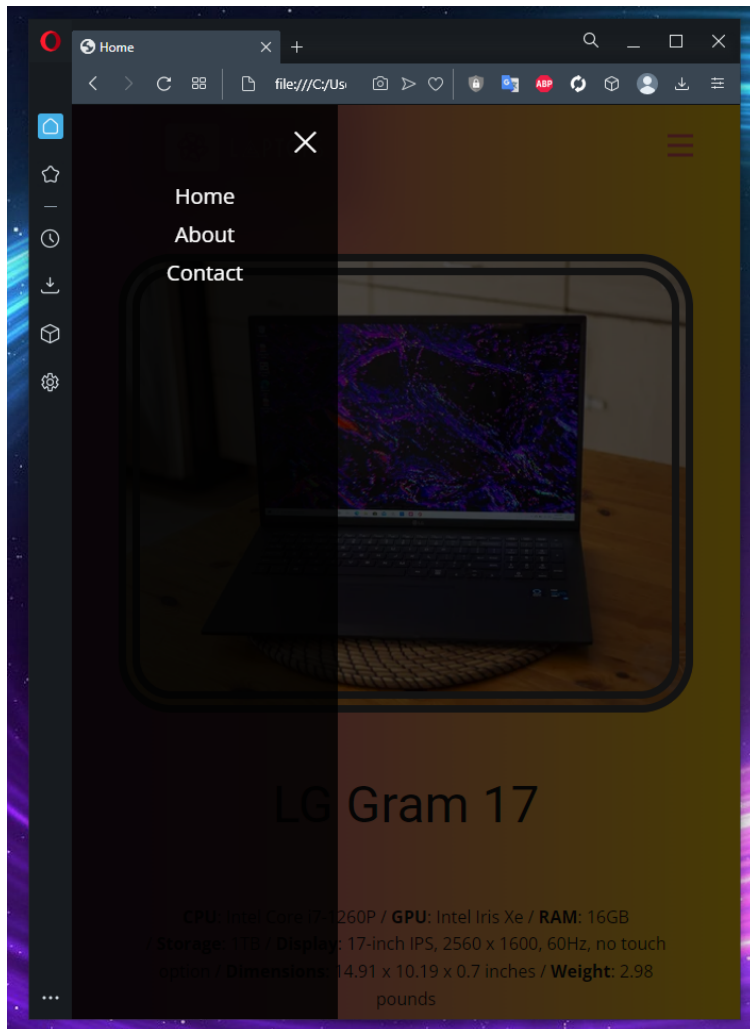

On the bottom, a bar war implemented to include a small description and the name of the creator.

The website was also designed to fit any screen size and adapt to phone screens automatically, fitting the elements in a different way. As it was taught in the class.

The menu on top right will also turn into a triple line button, opening a slider menu from the left when clicked on, when in the phone alignment.

Thanks for reading.
